Mesa™ PIV

Mesa PIV, the high power diode pumped Nd:YAG laser

Mesa PIV is a dual oscillator/single head, high repetition rate, diode-pumped Nd:YAG laser. It offers ultimate flexibility for PIV and other dual output applications.

The combination of two oscillators allows complete control of pulse separation and pulse energy. Both oscillators in the Mesa PIV are identical in optical design giving temporally and spatially matched pulses for the highest degree of cross-correlation. Each oscillator can be independently triggered via TTL inputs. As an option, a compact, external combination box can be directly attached to the laser to make access to the beam combination optics easier and safer for the rest of the laser system.
